Gartner Says Cloud, Mobility and Open Source Will Drive Application Development Market to Exceed \$9 Billion in 2012

Analysts Explore Emerging Trends at the Gartner Application Architecture, Development and Integration Summit in Sydney, 22-23 August and Las Vegas, 27-29 November 2012

Sydney, Australia, August 22, 2012—

The worldwide application development (AD) software market is expected to reach more than \$9 billion in 2012, an increase of 1.8 percent over 2011, according to Gartner. In Australia, spending on application development software is expected to reach A\$153.4 million in 2012, up 5 percent over 2011. Growth will be driven by evolving software delivery models, new development methodologies, emerging mobile application development and open source software.

“Application modernization and increasing agility will continue to be a solid driver for AD spending, apart from other emerging dynamics of cloud, mobility and social computing,” said Asheesh Raina, principal research analyst at Gartner. “These emerging trends are directing AD demand towards newer architectures, programming languages, business model and user skills.”

According to a new Gartner report, ‘Market Trends: Application Development Software, Worldwide, 2012-2016’, cloud is changing the way applications are designed, tested and deployed, resulting in a significant shift in AD priorities. Cost is a major driver, but also agility, flexibility and speed to deploy new applications. 90 percent of large, mainstream enterprises and government agencies will use some aspect of cloud computing by 2015.

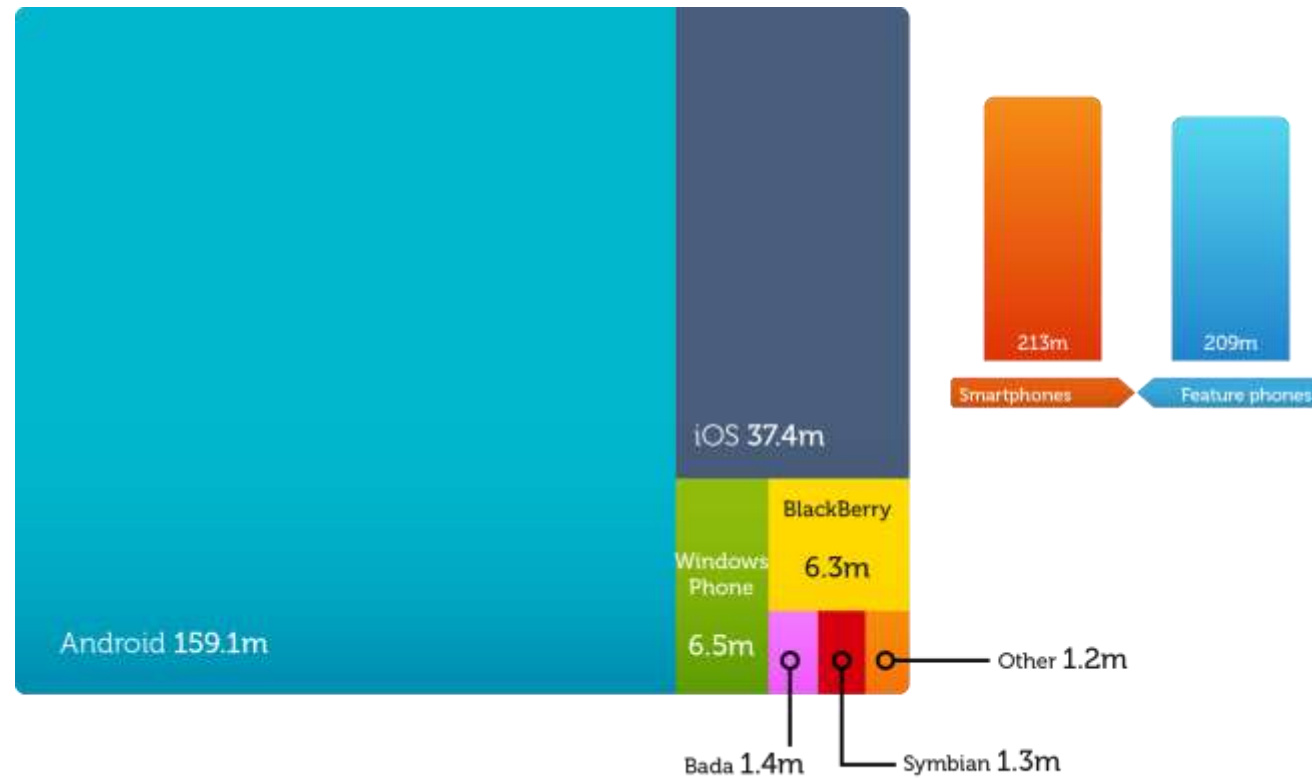

“The trend is compelling enough to force traditional AD vendors to ‘cloud-enable’ their existing offerings and position them as a service to be delivered through the cloud,” said Mr. Raina. “AD for cloud demands rapid deployment, a high focus on user experience and access to highly elastic resources for software testing, while requiring comparatively less underlying infrastructure for developing applications.”

Gartner also predicts that mobile AD projects targeting smartphones and tablets will outnumber native PC projects by a ratio of 4:1 by 2015. Emerging mobile applications, systems and devices are transforming the AD space rapidly, and are one of the top three CIO priorities at the enterprise level. Gartner research found that CIOs expect more than 20 percent of their employees to use tablets instead of laptops by 2013, hastening the process of change as AD tools and applications evolve to address the requirements of these new devices.

Also driving the AD shift, Gartner expects open source software to continue to broaden its presence and create pressure on market leaders during the next three to

Genero Mobile

Mobile Enterprise Application Platforms (MEAP) – Wikipedia definition

- Multiple device types,
 - Smartphone, tablet,
 - Abstract 4GL style code.
- Extend corporate network,
 - On-line and off-line,
 - Multiple server data sources,
 - Cloud enabled.
- Secure,
- Central app. management,
- Leverage existing skills and tools.

A screenshot of the Wikipedia article for 'Mobile enterprise application platform'. The page includes the Wikipedia logo, a navigation sidebar with links like 'Main page', 'Contents', and 'Tools', and the main article content. The article title is 'Mobile enterprise application platform' and it includes a 'Contents' table of contents with sections like '1 Purpose', '2 Rule of three', and '3 Components and Features'. A notice at the top of the article states 'This article needs additional citations for verification'.

Article Talk

Mobile enterprise application platform

From Wikipedia, the free encyclopedia

This article **needs additional citations** for verification.

A **mobile enterprise application platform** (MEAP) is a comprehensive suite of products and gateway market^[1]

| |
|-------------------------------------|
| Contents [hide] |
| 1 Purpose |
| 2 Rule of three |
| 3 Components and Features |
| 3.1 Structure |
| 3.2 Features and capabilities |

Purpose [edit]

MEAPs address the difficulties of developing mobile software by managing the diversity of device types and providing a long-term approach to deploying mobility. Cross-platform considerations are one big driver (for smartphones, tablets, notebooks and ruggedized handhelds) with no changes to the underlying business logic.

Platform applications are best for companies that wish to deploy multiple applications on a wide range of devices. Development templates to simplify and speed the mobile application development workflow.

Genero Mobile

Genero Mobile – best of both worlds, cross-platform, native development

- Cross-platform
 - iOS, Android = 90% market.
- Native 'look & feel'
- On-line & off-line modes
- Embedded SQLite
- Database sync.
- RESTful Web services
 - JSON,
 - SOAP.
- UTF-8 for international markets

Write once, deploy everywhere

No need to choose – one source code, one development cycle, one product to support

```
private function editCustomer(num)
    define num like customer.customer_num
    let int_flag = false

    -- Fetch customer record from database table
    select *
    into customer.*
    from customer
    where @customer_num == num

    -- Get input from form for customer record
    input by name customer.* without defaults
    on action zoom infield state
        let customer.state = states.getState(customer.state)
        display by name customer.state
    end input

    -- Update customer record to database table or redisplay
    if not int_flag then
        update customer
        set customer.* = customer.*
        where @customer_num = num
    else
        select *
        into customer.*
        from customer
        where @customer_num == num
        display by name customer.*
    end if
end function
```

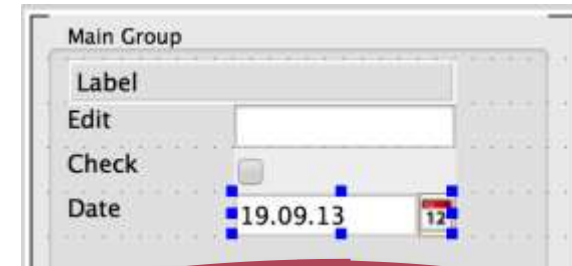

Write once, deploy everywhere

No need for deep API knowledge

- Native widgets

```
public function showForm()  
  
  open window wForm with form "simple2"  
  
  let pEdit = 3  
  let pDate = today  
  
  input by name pEdit, pCheck, pDate without defaults  
    on action foo  
      display "foo"  
    on change pCheck  
      display "ON CHANGE pCheck:", pCheck  
    on action bar  
      display "bar"  
  end input  
  
  close window wForm  
  
end function
```

Abstract form description

A diagram showing an abstract form description. It consists of a rectangular box with a light gray background and a thin border. Inside the box, the text "Main Group" is at the top left. Below it, there are four rows of form elements: "Label" followed by a gray rectangular box; "Edit" followed by a white rectangular input field; "Check" followed by a small square checkbox; and "Date" followed by a date input field containing "19.09.13" and a small calendar icon. Blue dashed lines are drawn around the date input field, and a red arrow points from this field down to the native rendering examples below.

A screenshot of a native mobile application rendering a table. The table has a light blue background and a white border. It contains a list of months and their corresponding dates and years. The text is in a sans-serif font.
